

access()

Check file accessibility.

```
#include <unistd.h>

int result = access("/path/to/file", F_OK); // Check existence
int result = access("/path/to/file", R_OK); // Check readable
int result = access("/path/to/file", W_OK); // Check writable
int result = access("/path/to/file", X_OK); // Check executable (for CGI)
```

Flags:

- F_OK File exists
- R_OK File is readable
- W_OK File is writable
- X_OK File is executable

`access()` checks real user ID, not the effective ID.
For CGI, you may need different checks.
