

opendir()

Open a directory.

```
#include <dirent.h>

DIR *dir = opendir("/path/to/directory");

if (dir != NULL) {
    struct dirent *entry;

    while ((entry = readdir(dir)) != NULL) {
        std::string name = entry->d_name;

        // Skip "." and ".." if you want
        if (name != "." && name != "..") {
            // Process file/directory name
        }
    }

    closedir(dir);
}
```

Members of `struct dirent`:

- `d_name` `char[]` File/directory name
- `d_type` `unsigned char` File type (not portable, avoid)

For portable file detection use `stat()` on the full path instead of `d_type`.
