

accept()

Accept a connection on a Socket.

```
struct sockaddr_in clientAddr;  
socklen_t clientAddrLen = sizeof(clientAddr);  
  
int clientFd = accept(listenFd, (struct sockaddr*)&clientAddr,  
    &clientAddrLen);
```

- Blocks until a client connects (unless non-blocking)
- Creates a new file descriptor for this specific client
- The original "listenFd" Socket continues listening for more clients

Never send/recv on "listenFd".
Never accept on "clientFd".
