

# bind()

Binds a name to a Socket.

```
struct sockaddr_in addr;  
  
addr.sin_family = AF_INET;  
addr.sin_addr.s_addr = INADDR_ANY; // Listen on all network  
interfaces  
addr.sin_port = htons(8080); // Convert to network byte  
order  
  
bind(listenFd, (struct sockaddr*)&addr, sizeof(addr));
```

Network Byte Order = Big-Endian. The CPU might be Little-Endian.

"htons()" (Host TO Network Short) converts the port number.

- "htons()":
  - Conversion: Host → Network (16-bit, port)
- "htonl()":
  - Conversion: Host → Network (32-bit, IP)
- "ntohs()":
  - Conversion: Network → Host (16-bit)
- "ntohl()":

- Conversion: Network → Host (32-bit)
