

Status Codes

The Status Code is a three-digit, decimal, integer value that represents the disposition of the server's attempt to satisfy the client's request.

A client may not understand each Status Code that a server reports but it must understand the class as indicated by the first digit and treat an unrecognized code as equivalent to the x00 code of that class.

Classes

Classes of HTTP Status Codes:

- 1XX informational
 - The request was received, continuing process.
- 2XX successful
 - The request was successfully received, understood, and accepted.
- 3XX redirection
 - Further action needs to be taken in order to complete the request.
- 4XX client error
 - The request cannot be fulfilled due to an issue that the client might be able to control.
- 5XX server error
 - The server failed to fulfill an apparently valid request.

Reason Phrases

The standard Reason Phrases are only recommendations. A web server is allowed to use a localized equivalent.

If a Status Code indicates a problem, the user agent might display the Reason Phrase to the user to provide further information about the nature of the problem.

The standard also allows the user agent to attempt to interpret the Reason Phrase, though this might be unwise since the standard explicitly specifies that Status Codes are machine-readable and Reason Phrases are human-readable.

Concrete Codes

- 200: OK
- 301: Moved permanently
- 400: Bad request
- 403: Forbidden
- 404: Not found
- 405: Method not allowed
- 413: Payload too large
- 500: Internal server error
- 501: Not implemented
- 505: HTTP version not supported
