

Checking The Value of Errno

Subject restriction: "Checking the value of errno to adjust the server behaviour is strictly forbidden after performing a read or write operation."

Meaning: After recv()/send() fails, you can check errno to know WHY, but you cannot change behavior based on it.

Just handle gracefully:

```
int ret = recv(fd, buffer, size, 0);
if (ret < 0)
{
    // Don't do this: if (errno == EAGAIN) { wait longer }
    // Do this:
    // Just remove client on any error
    removeClient(fd);
}
```

Check errno for debugging/logging, not for logic.
